No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence Sequence Sequence 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 3, Application US/09137759

Sequence 3, Application US/09137759

Patent No. 6251396

GENERAL INFORMATION

APPLICANT: Gaur, Amitabh

APPLICANT: Gaur, Amitabh

APPLICANT: Conlon, Paul J.

APPLICANT: Ling, Nicholas C.

APPLICANT: Staehlin, Theophil

APPLICANT: Staehlin, Theophil

APPLICANT: Staehlin, Theophil

TITLE OF INVENTION: METHODS FOR TREATMENT OF MULTIPLE SCLEROSIS USING

TITLE OF INVENTION: PEPTIDE ANALOGS OF HUMAN MYELIN BASIC PROTEIN

TITLE OF INVENTION NUMBER: US/09/137,759

CURRENT FILING DATE: 1998-08-20

SOFTWARE: Patentin Ver. 2.0

SEQ ID NOS: 8

SEQ ID NOS: 8

SEQUENCE: Applicant Number OF SEQ ID NOS: 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 2

US-00-640-344-1

i Sequence 1, Application US/08640344

i Patent No. 5824315

GENERAL INFORMATION:

APPLICANT: MAG, BISHWAJIT

APPLICANT: MIKKU, PRABHA

TITLE OF INVENTION: IMPROVING BINDING AFFINITY OF ANTIGENIC

TITLE OF INVENTION: PEPTIDES FOR WHC MOLECULES

NUMBER OF SEQUENCES: 18

CORRESPONDENCE ADDRESS:

ADDRESSEE: TOWNSEND & TOWNSEND & CREW LLP

STREET: TWO BRHARCADERO CENTER, 8TH FLOOR

CITY: SAN FRANCISCO

STATE: CALIFORNIA

COUNTRY: U.S.A.

ZIP: 94111-334

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IPAM PC COMPALIBLE

COMPUTER: PATENTIN Release #1.0, Version #1.30

CURRENT APPLICATION DATH:

CLASSIFICATION NUMBER: US/08/640,344

FILING DATE: 30-DANMINGN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 3, Application US/08640344

Patent No. 5824315

The Contribution of phosphorylation and loss of COOH-terminal
The contribution of the COOH of the most abundant protein component of the myelin membrane in the COOH as a role in both the formation and stabilization of this compact multilayer arrangement of bilayers.

Each splice variant and charge isomer may have a specialized function in the assembly of an optimized, biochemically functional myelin membrane (By similarity).

The SUBGNIT: Homodimer (By similarity).

SUBGNIT: Homodimer (By similarity).

The SUBGNIT: Homodimer (By similarity).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   nervous system.

The state of charge isomers; C1 (the most cationic, least modified, and most abundant form), C2, C3, C4 and C5 (the least cationic form); are produced as a result of optional posttranslational modifications such as phosphory/lation of serine or threonine residues, deamidation of glutamine or apparagine residues, citrullination and methylation of arginine residues. C1 and C2 are unphosphorylated, C3 and C4 are monophosphorylated and C5 is phosphorylated at two positions.

SIMILARITY: Belongs to the myelin basic protein family.
                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            NUCLECTION SEQUENCE OF '-156.

J. Biol. Chem. 258:330-937(1983).

-! FUNCTION: Is, with PLP, the most abundant protein component of the myelin membrane in the CNS. Has a role in both the formation and stabilization of this compact multilayer arrangement of bilayers. Each splication of this compact multilayer arrangement of bilayers. Each splic variant and charge isomer may have a specialized function in the assembly of an optimized, biochemically functional myelin membrane (By similarity).

-! SUBUNIT: Homodimer (By similarity).

-! SUBCELLULAR LOCATION: Cytoplasmic side of myelin.

-! TISSUE SPECIFICITY: Found in both the central and the peripheral
                                                   human fragments.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           as a result of optional posttranslatonial modifications, such as phosphorylation of serine or threonine residues, deamidation of glutamine or asparagine residues, citrullination and methylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nervous system.
PTM: As in other animals, several charge isomers may be produced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

Biochemistry 19:1826-1831(1980).

Biochemistry 19:1826-1831(1980).

FUNCTION: Is, with PLP, the most abundant protein component of the myelin membrane in the CNS. Has a role in both the formation and stabilization of this compact multilayer arrangement of bliayers. Bach splice variant and charge isomer may have a specialized function in the assembly of an optimized, biochemically functional myelin membrane (By similarity).

-I SUBUNIT: Homodimer; self-associates in the presence of lysolipid.
-I SUBCELLULAR LOCATION: Cytoplasmic side of myelin.
-I TISSUE SPECIFICITY: Found in both the central and the peripheral
                                                                                                                                                                                                                                                                 Erickson A.V., Payne D.M., Martino P.A., Rossomando A.J., Shabanowitz J., Weber M.J., Hunt D.F., Sturgill T.W.; "Identification by mass spectrometry of threonine 97 in bovine myelin basic protein as a specific phosphorylation site for mitogen-activated protein kinase.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           'Sedimentation analysis of the self-association of bovine myelin basic

"Determination of the sites of posttranslational modifications in the charge isomers of bovine myelin basic protein by capillary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nervous system.

PTM: At least 6 charge isomers; C1 (the most cationic and least modified form), C2, C3, C4, C5 and C6 (the least cationic form); are produced as a result of optional posttranslatonial modifications, such as phosphorylation of serine or threonine residues, deamidation of glutamine or asparagine residues, citrullination and methylation of arginine residues.

SIMILARITY: Belongs to the myelin basic protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Induces experimental autoimmune encephalomyelitis (EAE) 1.

-i- FUNCTION: Is, with PLP, the most abundant protein component of the myelin membrane in the CNS. Has a role in both the formation and stabilization of this compact multilayer arrangement of bilayers. Each splice variant and charge isomer may have a specialized function in the assembly of an optimized, biochemically functional myelin membrane (By similarity).

-i- SUBCELDUAR LOCATION: Cytoplasmic side of myelin.

-i- PTM: As in other animals, several charge isomers may be produced as a result of optional posttranslatonial modifications, such as phosphorylation of serine or threonine residues, deamidation of serine or threonine residues, deamidation of serine or threoline residues, details on methylation of serine or threoline residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This Swiss-Prot entry is copyright. Kira J.-1., Deibler G.E., Krutzsch H.C., Martenson R.E.;
J. Neurochem. 44:1653-165(1985).

-!- FUNCTION: 18, with PLP, the most abundant protein component of the myelin membrane in the CNS. Has a role in both the formation and stabilization of this compact multilayer arrangement of bilayers. Each splice variant and charge isomer may have a specialized function in the assembly of an optimized, biochemically functional myelin membrane (By similarity).
-!- SUBGNIT: Homodimer (By similarity).
-!- SUBGLIGILAR LOCATION: Cytoplasmic side of myelin.
-!- PTM: As in other animals, several charge isomers may be produced as a result of optional posttranslatonial modifications, such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

immune response Inducing a Th2 immune response and a persistent systemic immune respont to myelin basic protein, MBP, or a peptide analog of MBP for use in treating multiple sclerosis, by administering compositions comprising peptide analogs of MBP.

Example 10; Fig 8; 112pp; English.

The present sequence represents a peptide derived from human myelin basic protein. Myelin basic protein is found in the cytoplasm of human oligodendroglial cells. Peptide analogue derived from the present sequence are administered to a patient in need to induce a Th2 immune response (i.e. production of T cells producing one or more Th2-type cytokines) and/or a persistent systemic immune response to myelin basic protein. These peptide analogues are at least seven amino acids long, derived from residues 83-99 of human myelin basic protein and altered

```
The present invention relates to a novel method for inducing Th2 immune responses to Myelin Basic Protein (MBP) or a peptide analogue of MBP in a patient. The method involves administering a composition comprising the MBP peptide analogue CGP 77116 (NBI-5788). The method is useful for treating multiple sclerosis (MS). Sequences of the invention are also used as vaccines. The present sequence is a peptide related to human MBP
of the invention of peptide region 83-99 of Myelin basic protein (MBP)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducing Th2 immune responses to Myelin Basic Protein (MBP) by administering the MBP peptide analog CGP 77116, useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The immune response, myelin basic protein, MBP; vaccine, MS; multiple sclerosis; antisclerotic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     100.0%; Score 94; DB 5; 100.0%; Pred.                                                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method for selecting a tolerogenic peptide, comprising selecting a peptide which is capable of binding to a major histocompatibility complex (MHC) class I or II molecule without further processing. The peptides of the invention are useful for preventing a disease such as hypersensitivity disorder, and also for treating and/or preventing a disease in a subject. The method involves identifying an intigen for the disease, identifying an apitope (antigen processing independent epitope) for the antigen, and administering the apitope to the subject. The peptides of the invention are also useful for treating independent epitope) for the invention are also useful for treating curricaria, autoimmune diseases such as multiple sclerosis, altergoic thinitis, utricaria, autoimmune diseases under a multiple sclerosis, autoimmune thyroiditis, Grave's disease, systemic sclerosis, arcoidosis, autoimmune trejection. The peptides are also useful for modifying antiviral CD8+ responses in a tolerogenic fashion. This sequence represents an apitope

Immunoabsorption column, useful for treating multiple sclerosis, contains glycopeptides able to react with disease-specific autoantibodies.
                                                                                                                                                                                                                                                                                                                                                                           containing conjugates comprising glycopeptides which are able to recognize antibodies implicated in multiple sclerosis. The column removes harmful antibodies selectively, leaving all other components of the serum unchanged. The column is used to treat multiple sclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                       ABP97937-44 represent glycopeptides of a formula given in the specification. The glycopeptides are used to produce columns of the invention. The specification describes immunoabsorption columns,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Glycopeptide #5 for diagnosis and treatment of multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel glycopeptides comprising a specific tetrapeptide, useful as diagnostic tools for identifying multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Glycopeptide; neuroprotective; autoantibody; multiple sclerosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                           novel peptide used in the treatment of autoimmune disease e.g. multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a peptide used in the treatment of autoimmune disease e.g. multiple sclerosis (MS). More particularly, it concerns a Teel receptor sequence found in some MS patients and methods for its detection. T cell receptors comprise alpha and beta chains, with beta chains comprising the following regions from N-terminus to C-terminus. Wbeta-Dbeta-Dbeta-Cheta. T cell receptors naturally vary in the Vbeta-Dbeta-Dbeta-Grean. The peptides of the invention are used for treating autoimmune disease e.g multiple sclerosis. The present sequence is a peptide analogue used in the exemplification of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a fusion molecule comprising a first polypeptide sequence capable of specific binding to a native IgG inhibitory receptor consisting of an immune receptor tyrosine-based inhibitory motif (ITIM), expressed on mast cells, basophils or B cells, functionally connected to a second polypeptide sequence capable of specific binding directly or indirectly to a native IgE receptor (FeepsilonR). Also provided are nucleotide sequences encoding such a fusion procein. The fusion molecules and compositions are useful for treating an IgE-mediated biological response, preferably an IgE-mediated fusion processensitist, severe food allergies, chronic urticaria, angloedema or anaphylactic shock; or autoimmune diseases such as rheumatoid arthritis, chapting from, a type I hyporsenstitisty reaction in a subject receiving immunotherapy. The present sequence is the human myelin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                       The present invention relates to glycopeptides (ABR56059-ABR56066). The glycopeptides have high specificity in recognizing autoantibodies involved in multiple sclerosis pathology, and thus are effectively used in diagnosis and treatment for multiple sclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 comprising polypeptide sequences that bind to IgG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; Ig; immunoglobulin; immunotherapy; immune disease; MBP; Reeppilon receptor; autoimmune disease; constent region; heavy chain; antiathmutic; antiallergic; antialler

The invention discloses a method for inducing a Th2 immune response to myelin basic protein or its peptide analog in a patient, comprising administering a composition comprising a peptide analog in combination with a carrier/adjuvant or diluent. The peptide analog comprises at least of amino acids selected from residues 83 to 99 of human myelin basic protein, where: the L-1ysine at position 91, L-arginine at position 95, is altered to another amino acid, and one to L-threonine at position 95, is altered to another amino acid, and one to three L-amino acids selected from valine at position 86 or 87, histidine at position 88, threonine at position 95 or 98, and proline at position of the protein at that position or the L-1ysine at position 91 is altered at protein at that position or the L-1ysine at position 91 is altered to another amino acid and the N- and/or C-terminal amino acid are altered to another amino acid and the N- and/or C-terminal amino acid are altered con another amino acid, such that upon administration of the peptide canalog in vivo proteolysis is reduced. The peptide analog comprises 7-17 amino acids and one to four additional altered residues. The N-terminal contains additional L-amino acids selected from residues 81 to 90 and 92 to 99 to substituted with a charged amino acid. The method is useful for treating multiple sclerosis using peptide analogs of human myelin basic protein. The sequence presented is the wild-type human myelin basic protein. The sequence presented is the wild-type human myelin basic

New composition comprising at least one peptide having allele-specific binding motifs for HLA, useful for preventing, treating or diagnosing viral diseases and cancer.

Claim 1; Page 52-379; 382pp; English.

The invention relates to a composition comprising at least one peptide having an isolated, prepared epitope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducing a cytotoxic T cell response against a pre-selected antigen in a patient expressing a specific MFC class I allele by contacting cytotoxic T cells from the patient with the composition cited above. The composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a CTL or HTL epitope. The epitope is bound to an HLA molecule on the antigen-presenting cell, where when an A2 reseptor of the CTL binds to a complex of the HLA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HLA. The compositions and methods are useful for preventing, treating or diagnosing viral diseases and cancer. The peptide epitopes are useful as diagnosing viral diseases and cancer. The peptide point and antibodies and for evaluating efficacy of a vaccine. Sequences given in Tables 2-31.

having an isolated, prepared epitotope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducing a cytocoxic T cell response against a pre-selected antigon in a patient expressing a specific MFC class I allele by contacting cytotoxic C composition comprises an epitope that is joined by an amino acid linker. The epitope is admixed or joined to a CTL or HTL epitope. The epitope is bound to an HLA molecule on the antigon-presenting cell, where when an A2 restricted cytotoxic lymphocyte (CTL) is present, a receptor of the CTL binds to a complex of the HLA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HLA. The compositions and methods are useful for preventing, treating or C diagnosing viral diseases and cancer. The peptide epitopes are useful as diagnostic agents for evaluating immune responses, for making antibodies and for evaluating efficacy of a vaccine. Sequences given in ADW29251.
                                                                                                                                                                                                                                                                  Virucide, cytostatic, gene therapy, vaccine, epitope, cytotoxic T cell, MHC class I, CTL, HTL, A2-restricted cytotoxic lymphocyte, HLA, viral disease, cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New composition comprising at least one peptide having allele-specific binding motifs for HLA, useful for preventing, treating or diagnosing viral diseases and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a composition comprising at least one peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; Page 52-379; 382pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ò
                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a composition comprising at least one peptide having an isolated, prepared epitope selected from any of the sequences from 30 lists given in the specification. Also disclosed is a method for inducing a cytocoxic T cell response against a pre-selected antigen in a patient expressing a specific MHC class I allele by contacting cytotoxic T cells from the patient with the composition cited above. The composition comprises an apitope that is joined by an amino acid linker. The epitope is admixed or joined to a CTL or HTL epitope. The epitope is bound to an HAR molecule on the antigon-presenting cell, where when an A2-restricted cytocoxic lymphocyte (CTL) is present, a receptor of the CTL binds to a complex of the HLA molecule and the epitope. Specifically claimed are peptides having allele-specific binding motifs for HLA. The compositions and methods are useful for preventing, treating or diagnosing viral diseases and cancer. The peptide epitopes are useful as diagnosing viral diseases and cancer. The peptide epitopes are useful as and for evaluating efficacy of a vaccine. Sequences given in ADW29231.

ADW37745 represent epitopes of the invention as given in Tables 2-31.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

The present invention is direct to methods of isolating antigen specific CC T cells, especially T cells specific for self or autoantigens. This CC comprises incubating a sample of T cells obtained from a patient with the antigen and selecting T cells that express one or more of first markers cantigen and selecting T cells that express one or more of first markers selected from titerleukin-2, interferon-gamma, tumour necrosis factor alpha, interleukin-2, interferon-gamma, tumour necrosis factor alpha, interleukin-2, interferon-gamma, tumour necrosis factor alpha, interleukin-2, interferon-gamma, tumour necrosis factor alpha, interleukin-10 and interleukin-12. The call squeoise of autoimmune diseases. The methods also permit the disease and for monitoring the efficacy of treatment. The methods also permit the cite allow the preparation of autologous T cell vaccines for the treatment of the disease and for monitoring the efficacy of treatment. The methods also permit interpretation of autologous T cell vaccine preparation involves the specific T cells optionally followed by culturing steps which allow the expansion of the population of isolated antigency specific T cells optionally followed by culturing steps which allow the example from the population of isolated antigency specific T cells for T cell vaccination. Peripheral blood of monouclear cells were isolated from the blood of multiple sclerosis comprises amino acids 10-126 of human myelin basic protein. Cells were comprises amino acids for the expression of gene products indicative of activated from the langered for the expression of gene products indicative of activated from the langered for the expression of gene products indicative of activated from the langered from the l
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    T cells, and myelin-reactive T cells were propagated in culture. The methods and compositions of the invention are useful for the diagnosis and/or treatment of autoimmune diseases or T cell associated conditions such as multiple sclerosis myasthenia gravis, psoriasis, systemic lupus erythematosus, autoimmune thyroiditis, Grave's disease, inflammatory bowel disease, diabetes and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolating one or more T cells specific for an antigen of interest comprises incubating a T cell sample with an antigen, useful for diagnosing or treating multiple sclerosis, psoriasis, thyroiditie, diabetes and rheumatoid arthritis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention comprises a method of determining etiology of an autistic spectrum disorder in a patient. The method involves determining the level of an infectious agent, toxic chemical, or dieterry protein derived antigen, or their antibodies in samples of patient, and comparing antigens/antibodies levels with normal levels of antigens/antibodies from control subjects. The method of the invention is useful for determining the etiology of an autistic spectrum disorder, such as autism, pervasive development disorder and Asperger's syndrome. The present amino acid sequence represents a peptide that was used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining etiology of autistic spectrum disorder in patient, by determining level of infectious agent/toxic chemical/dietary protein derived antigen in samples of patient, comparing it with normal level of antigens of control subjects.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         pharmaceutical; t-lymphocyte; antigen; multiple sclerosis; utcimmune disease; immuned disorder; immune stimulation; immunity; autoimmunity; immunosuppressive; neuroprotective; antiarthritic; antiinflammatory; myelin; myelin basic protein; MBP.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method of diagnosing the likelihood and severity of demyelinating diseases. The method involves determining antibodies against neuron-specific antigen in sample, comparing the level of antibodies with the normal level of antibodies, where normal level of antibodies for the antigen indicate optimal conditions, lower than or higher than normal level of antibodies for the antigen indicate an absence of or a likelihood of demyelinating diseases, respectively. The neuron-specific antigen is chosen from myelin basic protein (MBP), well noligodendrocyte glycoprotein, myelin associated glycoprotein (MAG), proteolipid protein (PLP), small heat shock protein, transaldolase, glial fibrillary protein, S-100 protein, cross-reactive peptide from dietary protein, cross-reactive peptide from infectious agent, glutamate receptor, and phosphodiesterase. The immunoassay is an enzyme linked immunosorbent assay (ELISA) test. The method is useful for disapposing the likelihood and severity of demyelinating diseases such as multiple sclerosis in a patient. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Diagnosing likelihood and severity of demyelinating disease, by determining antibodies against neuron-specific antigen, comparing level of detected antibodies with normal level for detecting absence/likelihood

Complex peptide mixture having immunomodulatory effects, useful for preparing medicament for treating autoimmune disease e.g. multiple sclerosis, rheumatoid arthritis, for preparing medicament for stimulating immune cell.

Example; Page 22; 51pp; English

The invention relates to complex peptide mixtures comprises several peptides having 8-20 amino acids, where the mixture comprises peptides having a degree of diversity at defined positions in the peptide chain, where the degree of diversity in the defined position is different from other defined positions, and where in the majority of the mixture, the peptides includes Ala, Glu, Lys and Tyr and no other amino acids, in at least four positions. Also described are: (1) a method of creating a high affinity peptide ligand of a defined formula for a receptor of a T cell that is reactive to a myelin antigen, copolymer, or an active mixture; and (2) a method of enhancing a biological property of a complex mixture of peptides, peptidomimetics, or peptides and peptidomimetics. The complex peptide mixture is useful in the preparation of a medicament for treating a disease such as multiple sclerosis (MS) and experimental aucoimmune encephalomyelities (EAB). It is also useful for preparing a medicament for stimulating an immune cell, or for suppression of an immune reaction (e.g. autoimmune reaction) to an antigen derived from the examples of an encephalomyelities and peptide used in the examples of an encephalomyelities. the present invention.
